Introduction

EsPro is a quadcopter which is used to deliver medicine from local vendor to the customer. It can also detect authorized customer using computer vision based program. The manufacturing and control system of the drone has a user friendly interface so that people with minimum training can be in charge of it.

Specifications

- Weight: 1.5 kg
- Pay Load: 0.5 kg
- Battery Power (Max/Min): 11.1 V/10.5 V
- Thrust Generated: 3600 gm
- Flight Time: 10 minutes
- L×W×H (cm): 45×45×25
- Range: 1.5 km
- Tentative Manufacturing Cost: 20,000-22,000/-TK

Features

- Store to customer medicine delivery
- Navigation by using GPS module
- Customer authentication by QR scanning
- Real time visualization

Demonstration

https://drive.google.com/file/d/1dS_PM8ZE1Zt2CHK4sEKT10xjhz0PtYWt/view?usp=sharing

Components

Hardware:

Frame: Material- Plastic
Wheelbase – 450 mm

Motor: Type: Brushless DC motor, Model: A2212/13T
RPM/V: 1000 kV, Current: 4-10 A (at 75%)
No load current: 10 V/0.5 A
Shaft diameter: 3.17 mm, Dimensions: 27.5*28 mm
Thrust: 900 grams per motor, Total thrust: 900*4 = 3.6 kg

ESC: Simonk 30A (current rating)

Battery: 2200 mAh, 11.1 V, 3 cell LiPo Battery

Propeller: Length – 10 inch

Flight controller: Ardupilot APM 2.8 Flight Control Board

GPS Module: Ublox NEO-M8N GPS Module
Features:
Built-in compass GPS module
Main chip: Ublox-M8N
Fast satellite searching speed and high precision

Receiver transmitter: FlySky FS-i6
2.4G 6CH AFHDS RC Transmitter with FS-i6 Receiver
Bandwidth (kHz): 500, No. of channels – 6
Antenna length – 26 mm*2(dual antenna)
Transmitting power – maximum 20 dam
RF Receiver sensitivity -105 dbm

Power module: V2.0, Maximum output current–3A, 3-14S input voltage

Landing gear

ESP 32 camera+ Wi-Fi module

Shock absorber

Arduino UNO

Software

Arduino IDE

Python

Source Code

Arduino Code for ESP32 camera module:

The ESP32-CAM is a small size, low power consumption camera module based on ESP32. It comes with an OV2640 camera and provides onboard TF card slot. The ESP32-CAM can be widely used in intelligent IoT applications such as wireless video monitoring, WiFi image upload, QR identification, and so on. The following Arduino commands power up the camera to create its own wifi zone and after few manual steps, the camera can connect itself to any local area network (LAN) to transmit information.

The screenshot displays the Arduino IDE environment with the 'CameraWebServer' sketch loaded. The code includes headers for 'esp_camera.h', 'WiFi.h', and 'WiFiManager.h', and defines the camera model as 'CAMERA_MODEL_AI_THINKER'. It sets up a camera configuration structure with various GPIO pins and then calls 'startCameraServer()' and 'setup()'. The 'setup()' function initializes the serial port and prints a message. Below the code, a red error message is visible: 'Error downloading https://expressif.github.io/arduino-esp32/package_esp32_index.json'. Below the IDE, a web browser window shows the 'WiFiManager' interface at the IP address 192.168.4.1. The interface has a title 'WiFiManager' and a subtitle 'MyCamera'. It contains four blue buttons: 'Configure WiFi', 'Info', 'Exit', and 'Update'. At the bottom, there is a status box that says 'No AP set'.

```
#include "esp_camera.h"
#include <WiFi.h>
#include <WiFiManager.h>
#define CAMERA_MODEL_AI_THINKER // Has PSRAM
#include "camera_pins.h"

void startCameraServer();

void setup() {
  Serial.begin(115200);
  Serial.setDebugOutput(true);
  Serial.println();

  camera_config_t config;
  config.ledc_channel = LEDC_CHANNEL_0;
  config.ledc_timer = LEDC_TIMER_0;
  config.pin_d0 = Y2_GPIO_NUM;
  config.pin_d1 = Y3_GPIO_NUM;
  config.pin_d2 = Y4_GPIO_NUM;
  config.pin_d3 = Y5_GPIO_NUM;
  config.pin_d4 = Y6_GPIO_NUM;
  config.pin_d5 = Y7_GPIO_NUM;
  config.pin_d6 = Y8_GPIO_NUM;
  config.pin_d7 = Y9_GPIO_NUM;
  config.pin_xclk = XCLK_GPIO_NUM;
  config.pin_pclk = PCLK_GPIO_NUM;
  config.pin_vsync = VSYNC_GPIO_NUM;
  config.pin_href = HREF_GPIO_NUM;
```

Update

No AP set

A local network is selected to which the ESP32 module can get connected.

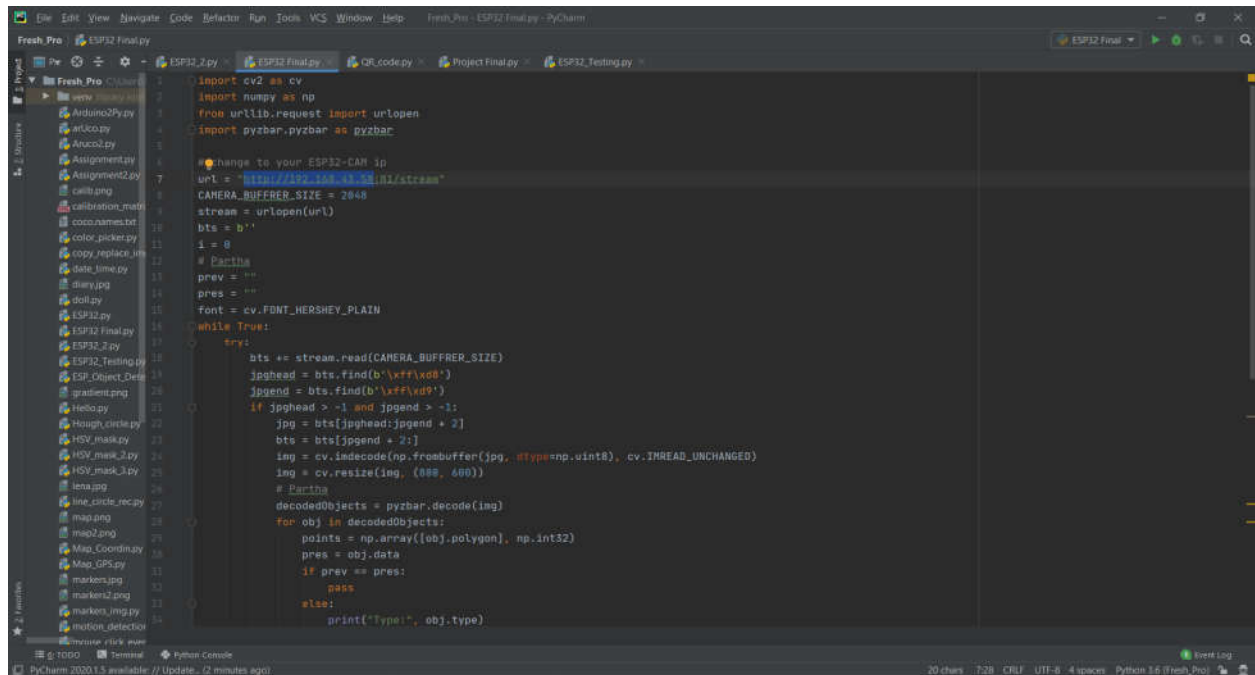

The serial monitor will then return an IP address to access the camera module.

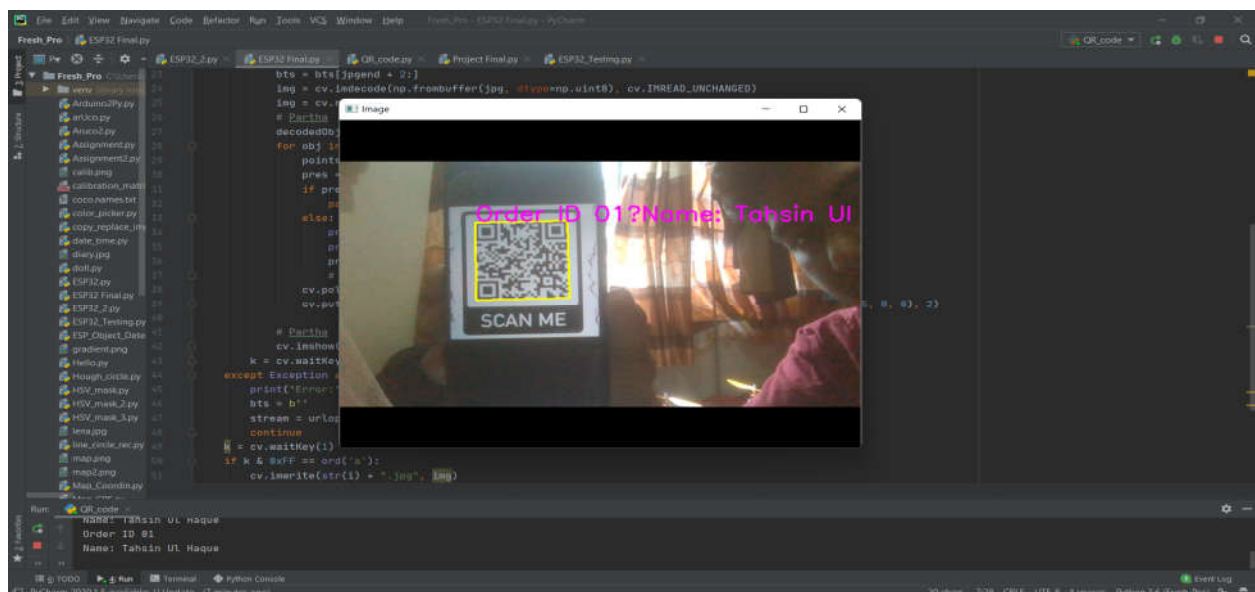

QR Code detection and varification.

The live camera information is fed into a Python command using OpenCV. OpenCV (Open Source Computer Vision Library) is an open source computer vision and machine learning software library. If any QR code is visible to the camera, the OpenCV-Python command will detect it. Some kind of action (door opening, green LED blinking etc.) will be executed if the QR code information matches an authorized one.

```
1 import cv2 as cv
2 import numpy as np
3 from urllib.request import urlopen
4 import pyzbar.pyzbar as pyzbar
5
6 # change to your ESP32-CAM ip
7 url = "http://192.168.1.100:81/stream"
8 CAMERA_BUFFER_SIZE = 2948
9 stream = urlopen(url)
10 bts = b''
11 i = 0
12 # Partha
13 prev = ""
14 pres = ""
15 font = cv.FONT_HERSHEY_PLAIN
16 while True:
17     try:
18         bts += stream.read(CAMERA_BUFFER_SIZE)
19         jpghead = bts.find(b'\xff\xd8')
20         jpgend = bts.find(b'\xff\xd9')
21         if jpghead > -1 and jpgend > -1:
22             jpg = bts[jpghead:jpgend + 2]
23             bts = bts[jpgend + 2:]
24             img = cv.imdecode(np.frombuffer(jpg, dtype=np.uint8), cv.IMREAD_UNCHANGED)
25             img = cv.resize(img, (888, 600))
26             # Partha
27             decodedObjects = pyzbar.decode(img)
28             for obj in decodedObjects:
29                 points = np.array([obj.polygon], np.int32)
30                 pres = obj.data
31                 if prev == pres:
32                     pass
33                 else:
34                     print("Type:", obj.type)
```

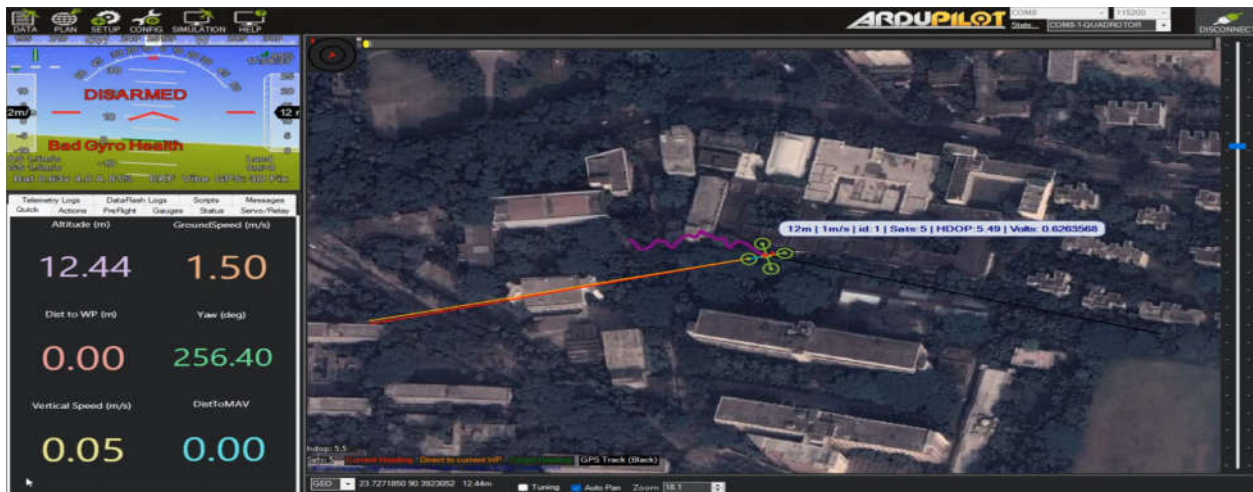

The OpenCV-Python command will extract every information the QR code conveys.

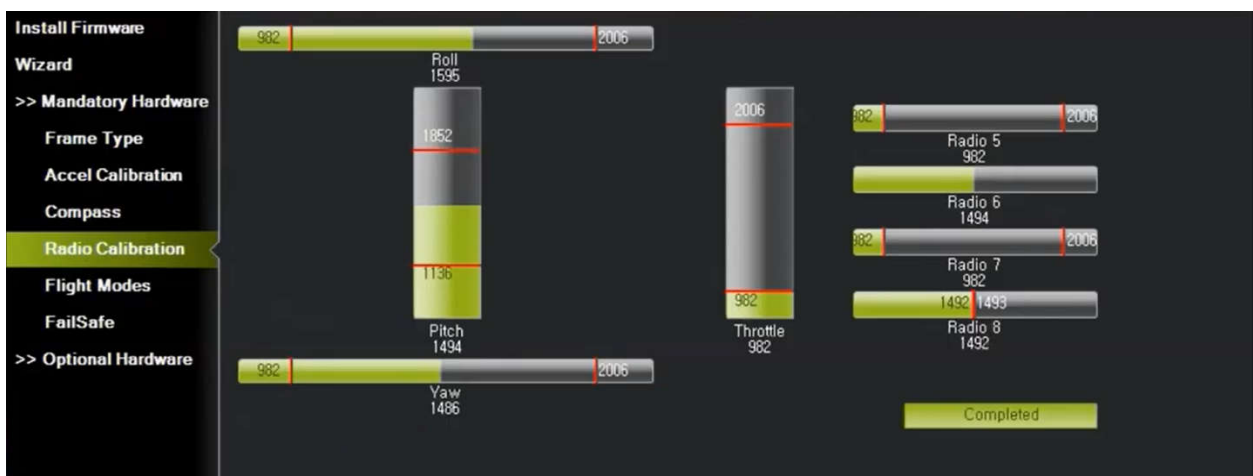

```
1 import cv2 as cv
2 import numpy as np
3 from urllib.request import urlopen
4 import pyzbar.pyzbar as pyzbar
5
6 # change to your ESP32-CAM ip
7 url = "http://192.168.1.100:81/stream"
8 CAMERA_BUFFER_SIZE = 2948
9 stream = urlopen(url)
10 bts = b''
11 i = 0
12 # Partha
13 prev = ""
14 pres = ""
15 font = cv.FONT_HERSHEY_PLAIN
16 while True:
17     try:
18         bts += stream.read(CAMERA_BUFFER_SIZE)
19         jpghead = bts.find(b'\xff\xd8')
20         jpgend = bts.find(b'\xff\xd9')
21         if jpghead > -1 and jpgend > -1:
22             jpg = bts[jpghead:jpgend + 2]
23             bts = bts[jpgend + 2:]
24             img = cv.imdecode(np.frombuffer(jpg, dtype=np.uint8), cv.IMREAD_UNCHANGED)
25             img = cv.resize(img, (888, 600))
26             # Partha
27             decodedObjects = pyzbar.decode(img)
28             for obj in decodedObjects:
29                 points = np.array([obj.polygon], np.int32)
30                 pres = obj.data
31                 if prev == pres:
32                     pass
33                 else:
34                     print("Type:", obj.type)
```

Challenges

The main challenge we faced during the project is the shortage of components. Many of our plans had to be reshaped due to the lack of supply of electronic modules in the local market.

Sometimes available but cheap components did not work well and we had to move to their expensive alternatives. This happened to our GPS module and ESP32 module. We tried to use a 6M GPS module but it could not show the location of the drone very well. Therefore, we later used the 8M GPS module. Similarly, the Wi-Fi range, generated by the ESP32 module, was too small for a drone to operate. To extend the range we had to use an additional router module.

Flight controllers of the latest version were not available in Bangladesh. Therefore, it was a big challenge to get the proper firmware for the old version of the flight controller. After a lot of trial and error, we managed to operate the flight controller with the proper firmware.

Uncontrolled flights, sudden malfunctioning of onboard equipment, and drone's dropping down from the sky were big problems. These eventually led us to a broken arm, broken landing gears, and several broken propellers. However, all of those components were replaced with new ones and our final flights were very smooth.

Future Prospects

- Waypoint navigation
- Autonomous flight and landing
- Built in Sim Module
- Face Recognition
- Automated container opening & closing upon verification
- Built in software to collect order and payment electronically

In future with more advancement we can use this drone commercially in hospital sectors or battle field. In hospitals, the drone can move in a predetermined altitude and deliver medicine in wards and cabins by identifying patient records using AI.
